Everyday PLM tasks for design engineers

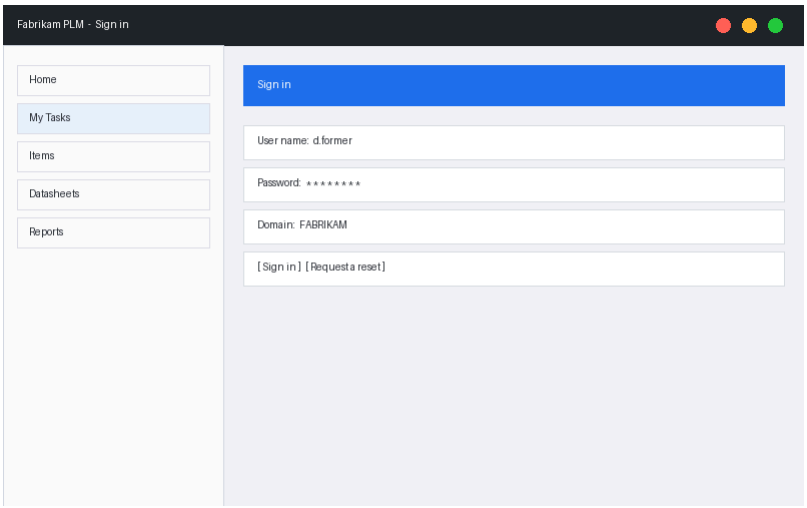

Revision 2.1

PLM Support: plm-support@fabrikam.example (555-0142)

FICTIONAL sample document, generated for demo purposes.

01 - LOGGING IN TO TEAMCENTER

Open your browser and go to teamcenter.fabrikam.example. Sign in with your network account. Your initial password is set by the PLM administrator and must be changed at first login; passwords expire every 90 days. If you forget your password, use the 'Request a reset' link on the login page or contact the PLM administrator.

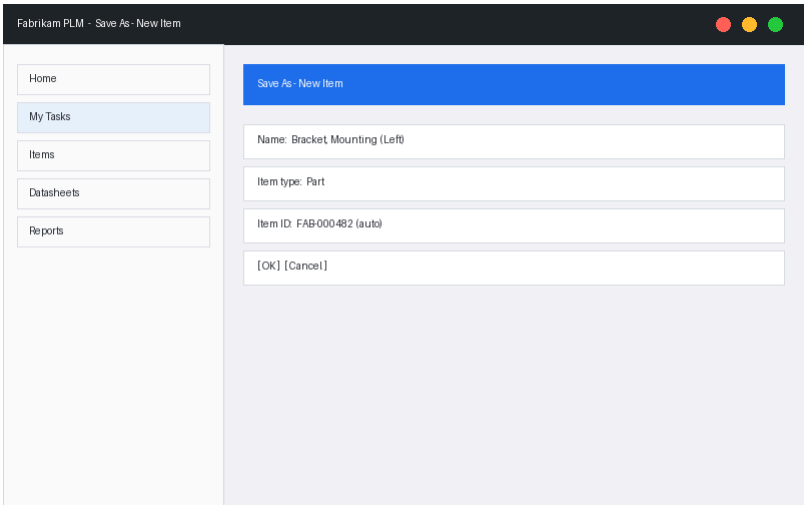

02 - CREATING A NEW ITEM

From Home choose Create > Item. Give the item a name and select an item type: use Part for a single component, Product for an assembly, and Document for drawings or specs. The PLM administrator can assign additional item types for your organisation.

03 - SAVE AS

Use File > Save As to save an existing item as a new item. Save As creates a new item ID and copies every attached dataset to it; the original item is not modified. Give the new item a meaningful name before you confirm, because the item ID cannot be changed afterwards.

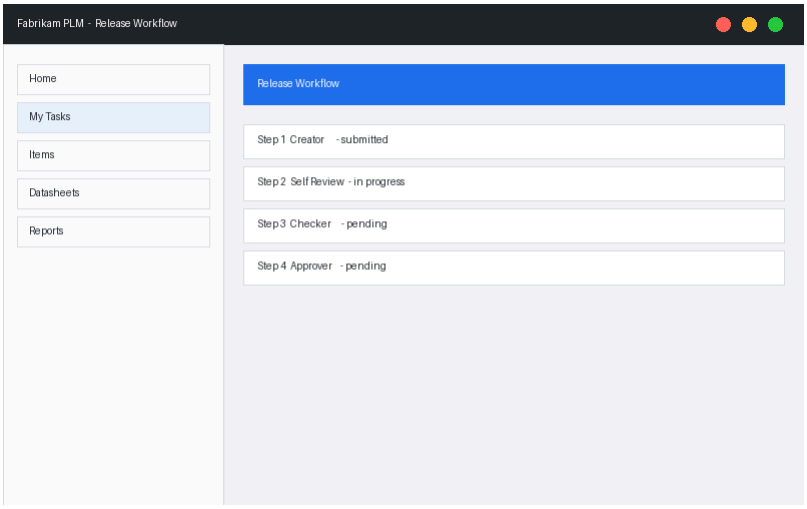

04 - CREATE NEW REVISION

Select the item and click Revise in the toolbar. Teamcenter creates the next revision letter (for example A becomes B), copies all datasets forward and makes the new revision the only editable one. The previous revision stays visible for reference but is locked.

05 - RELEASE WORKFLOWS

A release workflow can only be initiated by a user with the Creator role. Select the item, choose Add to Workflow > Release Workflow, add the required sign-off roles and click Start. Every approver is notified in their My Tasks list.

06 - REJECTING A WORKFLOW TASK

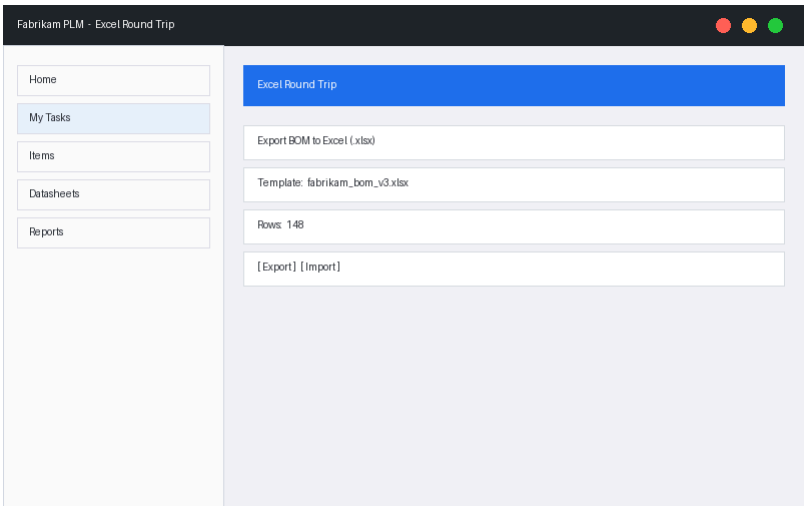

When the Checker rejects a task, the workflow sends the item back to the Creator for self review. The task reappears in the Creator's My Tasks list with the Checker's comments, and the workflow restarts at the review step once the Creator submits it again.

07 - COMMENTS ON WORKFLOW TASKS

A comment is mandatory when rejecting a workflow task, so the next person always knows what has to be fixed. When approving a task a comment is optional. Comments are stored in the item's workflow history and can be read later from View Revisions > Workflow History.

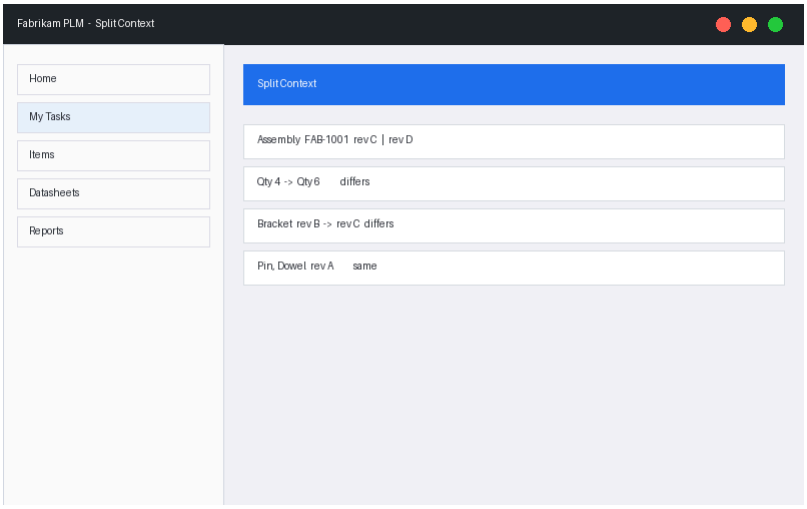

08 - EXPORTING A BOM TO EXCEL

Open the assembly and switch to the Structures tab. Select the root node and use the Excel Round Trip command to export the BOM to Excel. Edit quantities or part numbers in the spreadsheet, save it, then use Excel Round Trip > Import to write the changes back into Teamcenter. Row formatting from your template is preserved.

09 - COMPARING ASSEMBLY STRUCTURES

Open two structures and use Split Context to display them side by side. The comparison highlights differences in quantity, revision and position, so you can see exactly what changed between two releases of the same assembly.

10 - REVISION RULES

Set the revision rule in the toolbar before you open an assembly. The Latest Working revision rule shows the latest revision of the child parts, even if they are still being edited. Use Release Baseline when you need the exact configuration that was released.
